S = MSB value of the result is set.

Z = 1 is set when the result is 0, otherwise 0.

H = 0 is set.

V = 1 is set when the parity (number of 1s) of the result is even, 0 when odd.
When the operand is 32-bit, an undefined value is set.

N = Cleared to 0.

C = Cleared to 0.

Execution example: OR HL, IX

When the HL register = 7350H and the IX register is 3456H, execution sets the HL register to 7756H.

ORCF num, src

< OR Carry Flag >

Operation : $CY \leftarrow CY \text{ OR } \text{src} \langle \text{num} \rangle$

Description : Ors the contents of the carry flag with those of bit num of src and loads the result to the carry flag.

Details :

S = No change

Z = No change

H = No change

V = No change

N = No change

C = The result of or-ing the contents of the carry flag with those of bit num of src is set.

Execution example: ORCF 6, (100H)

When the contents of memory at address 100H = 01000000B (binary) and the carry flag = 0, execution sets the carry flag to 1.

PAA dst

< Pointer Adjust Accumulator >

Operation : if $\text{dst} \langle \text{LSB} \rangle = 1$ then $\text{dst} \leftarrow \text{dst} + 1$

Description : Increments dst by 1 when the LSB of dst is 1. Does nothing when the LSB of dst is 0.

Used to make the contents of dst even. With the TLCS-900 series, when accessing 16- or 32-bit data in memory, if the data are loaded from an address starting with an even number, the number of bus cycles is 1 less than that of the data loaded from an address starting with an odd number.

} Contents of the memory address specified by the stack pointer XSP are set.

Note1: Please execute this instruction during DI condition. The timing for executing this instruction is delayed by several states than that for fetching the instruction. This is because an instruction queue (4 bytes) and pipeline processing method is used.

Note2: When this instruction is executed, change all bits in the SR. If there are the bits which must not change (example: the minimum mode is not supported for 900/H, therefor, the SR<MAX> register must be set to "1"), prevent the bits from changing.

V = 1 is set when the parity (number of 1s) of dst is even after rotate. If the operand is 32 bits, an undefined value is set.

N = Reset to 0.

C = MSB value of dst before the last rotate is set.

Execution example: RLC 4, HL

When the HL register = 1230H, execution sets the HL register to 2301H and the carry flag to 1.

RLD dst1, dst2

< Rotate Left Digit >

Operation : $dst1 \langle 3:0 \rangle \leftarrow dst2 \langle 7:4 \rangle, dst2 \langle 7:4 \rangle \leftarrow dst2 \langle 3:0 \rangle,$
 $dst2 \langle 3:0 \rangle \leftarrow dst1 \langle 3:0 \rangle$

Description : Rotates left the lower 4 bits of dst1 and the contents of dst2 in units of 4 bits.
